Full-Stack Developer – AI27 Predictive Intelligence 28/06/2021 – Active Years of experience: 1 Year 11 months

My main functions in this position are to include and implement solutions with integral developments to create new functions for specific problems with development technologies such as Microsoft services, create scripts in the database, such as stored procedures, functions, and tables to manage the data, and then review and create new methods in the business logic to implement new functions for existing projects based on requirements that include message distributions, calculations within the dashboards to visualize new specific data. As well as on multiple platforms, rest API and web applications. Integrate bots and the use of geofencing to trigger messages via queues for customers who might need it. Implement communication protocols whose intercommunication processes are dedicated and required from 0 to 100 development on my part with GPS created in node.js on the server side, a gateway in windows was used. These gps are integrated with new technologies such as recharging by solar cells and sending data loads to the server and the messaging distributor to implement new solutions for customers. Use the other technologies as amazon alexa, and amazon lex.
